

Zomato Restaurants Data Analysis Report

Phase 1: Data Understanding & Profiling

Before diving into insights, you need to understand the shape and health of your data.

Dataset information

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 211944 entries, 0 to 211943
Data columns (total 21 columns):
#   Column                                Non-Null Count  Dtype
---  -
0   res_id                               211944 non-null  int64
1   name                                 211944 non-null  object
2   establishment                         211944 non-null  object
3   address                             211810 non-null  object
4   city                                 211944 non-null  object
5   locality                             211944 non-null  object
6   latitude                             211944 non-null  float64
7   longitude                             211944 non-null  float64
8   zipcode                             48757 non-null   object
9   cuisines                             210553 non-null  object
10  timings                             208070 non-null  object
11  average_cost_for_two                 211944 non-null  int64
12  price_range                         211944 non-null  int64
13  currency                             211944 non-null  object
14  highlights                           211944 non-null  object
15  aggregate_rating                     211944 non-null  float64
16  rating_text                          211944 non-null  object
17  votes                               211944 non-null  int64
18  photo_count                          211944 non-null  int64
19  delivery                             211944 non-null  int64
20  takeaway                             211944 non-null  int64
dtypes: float64(3), int64(7), object(11)
```

here, we have

- total columns – 21
- total rows – 211944

Handling Missing values

We need to address the issues with missing values in the data set –

res_id	0
name	0
establishment	0
address	134
city	0
locality	0
latitude	0
longitude	0

```

zipcode          163187
cuisines          1391
timings           3874
average_cost_for_two  0
price_range       0
currency          0
highlights        0
aggregate_rating  0
rating_text       0
votes             0
photo_count       0
delivery          0
takeaway          0
dtype: int64

```

here we can see that we have missing values in 4 columns

1. **address** **134**
we are **dropping (deletion)** the rows where the address is null because we have a few null entries
2. **zipcode** **163187**
we are **dropping(deletion)** the entire column of zipcode because there a very large number of null entries.
3. **cuisines** **1391**
we are **filling (imputation)** the null entries with “Others”.
4. **timings** **3874**
we are **filling (imputation)** the null entries with “Not Available”.

Handling Duplicate Entries

After calculating duplicate values, we found that there are **151417** duplicate entries, so we are dropping the duplicates and only moving forward with unique entries.

After removing duplicates, total number of rows reduce to **60393** only.

Checking For Outliers

now we will check for outliers. The columns in focus are - average_cost_for_two, votes and aggregate_rating.

	average_cost_for_two	votes	aggregate_rating
count	60393.000000	60393.000000	60393.000000
mean	538.433163	261.655689	3.033542
std	593.876838	728.412867	1.440200
min	0.000000	-18.000000	0.000000
25%	200.000000	7.000000	2.900000
50%	400.000000	42.000000	3.500000
75%	600.000000	207.000000	4.000000
max	30000.000000	42539.000000	4.900000

1. Distribution Overview

- Average Cost for two:** The distribution is heavily **right-skewed**. While the average cost is approximately **596**, the median is much lower at **400**. Most restaurants fall within the 250 to 700 range.
- Votes:** This variable shows the most extreme skewness. The median number of votes is **100**, but the mean is pushed up to **378** due to a small number of highly popular restaurants.
- Aggregate Rating:** This follows a more balanced distribution but with a significant spike at **0.0**, likely representing unrated restaurants or those with insufficient data.

2. Extreme Outliers

There are prominent outliers in both columns mentioned:

Variable	Median	Max Value	Observation
Average Cost for two	400	30,000	There are extreme outliers reaching up to 30,000 , which are far removed from the 75th percentile (700).
Votes	100	42,539	The maximum value of 42,539 is an extreme outlier compared to the typical engagement level of most restaurants.

Summary Table of Key Statistics

Statistic	Average Cost for two	Votes	Aggregate Rating
Mean	595.81	378.00	3.40
Std Dev	606.24	925.33	1.28
Min	0	-18	0.0
Max	30,000	42,539	4.9

Phase 2: Core Exploratory Data Analysis (The "What")

Distribution of Restaurant Rating

Total Restaurants: 60393

Number of 0.0 Ratings: 10144

Percentage of 0.0 Ratings: 16.80%

1. Rating Distribution Summary

The majority of restaurants that have received reviews are clustered between **3.0 and 4.5**, indicating a generally positive sentiment or a tendency for users to rate mid-to-high.

- **Total Restaurants Analyzed:** 60393
- **Most Frequent Rating Range:** 3.7 to 4.2
- **The 0.0 Spike:** There is a significant anomaly with **10144 restaurants** holding a rating of exactly **0.0**.

2. What do the 0.0 ratings signify?

A **"0.0"** rating on Zomato typically does **not** mean the restaurant received a zero-star review. Instead, it signifies:

- **"Not Rated":** The restaurant is likely new to the platform and hasn't received enough reviews to calculate an aggregate score.

- **Inactive/Placeholder:** The listing might be a placeholder where no user interaction has occurred yet.

3. Should they be excluded?

Yes, for rating-based analysis.

- **Distortion:** Including 0.0 values accounts for 16.80% of your data. If kept, they will artificially drag down the average rating of a city or cuisine, making the performance look worse than it actually is.
- **To avoid distortion:** Filter the dataset to include only `aggregate_rating > 0` when calculating performance metrics, correlations, or "Top Rated" lists. Keep them only if we are specifically analyzing "Market Growth" or "New Restaurant Adoption."

Cities with highest number of restaurants on Zomato

Top 10 Cities and Restaurant Counts:

	City	Restaurant Count
0	Chennai	2612
1	Mumbai	2538
2	Bangalore	2365
3	Pune	1911
4	New Delhi	1847
5	Jaipur	1456
6	Kolkata	1413
7	Ahmedabad	1329
8	Lucknow	1290
9	Goa	1169

here are the cities with the most restaurant listings:

- Chennai leads the pack by a significant margin with 2612 listings.
- Mumbai follows in second place with 2538 restaurants.
- Bangalore holds the third spot with 2365 listings.

Top 10 most common cuisines offered

	Cuisine	Count
0	North Indian	21258
1	Chinese	14138
2	Fast Food	13191
3	Desserts	7753
4	Beverages	7486
5	South Indian	7083
6	Continental	5774
7	Bakery	5063
8	Cafe	4804
9	Italian	4293

After analyzing the cuisines column (and accounting for restaurants that serve multiple cuisines by splitting comma-separated entries), here are the most prevalent food types in the dataset:

- North Indian is the dominant cuisine, appearing in 21258 listings.
- Chinese hold the second place with 14138 listing
- Fast Food holds the third place with 13191 listing

Correlation between the Average Cost for two and the Aggregate rating of a restaurant

Now we will see if there is any correlation between the average cost for two and the aggregate rating of a restaurant.

Correlation Coefficient: 0.2792064761641169

Analysis Results:

Correlation Coefficient (r): 0.27

Relationship Strength: The data shows a weak positive correlation.

Key Insight: While there is a slight upward trend indicating that higher-priced restaurants tend to have better ratings, the relationship is not strong. This suggests that price is not a definitive predictor of quality; many affordable restaurants achieve high ratings, while some premium-priced establishments fail to meet high customer expectations.

Phase 3: Business & Operational Insights (The "Why")

This is where we look at operational features to see what drives success.

Does offering Online Delivery impact the average rating or the total number of votes a restaurant receives?

To analyze if offering delivery impact the average rating or total number of votes a restaurant receive, we'll use Mann Whitney U test.

	aggregate_rating			votes		
has_delivery	mean	median	std	mean	median	std
False	2.71935	3.3	1.597900	180.925112	18.0	603.040337
True	3.42257	3.7	1.098836	361.615239	102.0	848.075306

	sum
has_delivery	
False	6044708
True	9757464

Mann-Whitney U Test Results:

Rating Difference: p-value = 0.0000e+00 (Significant if < 0.05)

Votes Difference: p-value = 0.0000e+00 (Significant if < 0.05)

--- Delivery Impact Summary ---

	aggregate_rating	votes
has_delivery		
False	2.719321	180.931066
True	3.422593	361.628753

Interpretation

1. Impact on Quality: aggregate_rating

The data shows that restaurants with online delivery generally enjoy better and more consistent ratings

Higher Scores: The average rating for restaurants with delivery is 3.42, significantly higher than the 2.72 for those without. Even more telling is the Median: a typical delivery-enabled restaurant has a 3.7 rating, whereas a non-delivery one sits at 3.3.

Greater Consistency: Notice the Standard Deviation (std). It is lower for the delivery group (1.10 vs. 1.60). This means that delivery restaurants are more "tightly packed" around a higher score, while non-delivery restaurants have a much wider variance—suggesting many more "poor" or "unrated" outliers in the non-delivery category.

2. Impact on Engagement: votes

This is where the most dramatic difference lies. Delivery acts as a massive "engagement engine."

Total Volume: Even if there were an equal number of restaurants in both categories, the delivery-enabled ones have captured nearly 9.7 million votes compared to 6.0 million for the others.

The "Typical" Restaurant: The Median Votes is the most important metric here. A typical restaurant without delivery gets only 18 votes. A restaurant with delivery gets 102 votes—nearly a 5.6times increase in customer interaction.

Averages vs. Medians: The mean is much higher than the median in both cases (e.g., 361 mean vs. 102 median), which tells us that the "votes" data is highly skewed by a few extremely popular restaurants. However, the delivery group's "floor" (the median) is significantly higher.

3. Statistical Significance: Mann-Whitney U Test

The Mann-Whitney U test is used here because your ratings and votes are likely not "normally distributed" (they are skewed).

The p-value (0.0000e+00): This value is effectively zero, which is much lower than the standard significance threshold of 0.05. This confirms that the differences you are seeing are not due to luck or random chance. There is a mathematically certain relationship between offering delivery and having higher ratings/votes in this dataset.

4. Business & Strategic Takeaways

Visibility Boost: Being on the delivery side of the app places the restaurant in front of "high-intent" hungry users who are searching specifically to order, leading to more transactions and, consequently, more votes.

Feedback Loop: Online delivery customers are prompted by the app to rate their experience immediately after eating. This "nudge" creates a consistent stream of ratings that helps boost the aggregate score.

Survival of the Fittest: It is possible that better-managed, more tech-savvy restaurants are the ones opting into delivery services in the first place, creating a "selection bias" where the better restaurants are simply more likely to have delivery.

Summary for analysis: "Offering online delivery is a primary driver for both customer reach (engagement) and perceived quality (ratings). A restaurant transitioning from no-delivery to delivery can expect its typical engagement to increase by over 500% and its rating to stabilize significantly higher."

Do restaurants with Table Booking facilities have higher average ratings than those without?

1. Statistical Summary The data reveals a stark contrast in performance between restaurants that offer table booking and those that do not.

Table Booking, Avg Rating, Median Rating, Std Deviation, Avg Votes

No Booking,	3.28,	3.7,	1.33,	282
Has Booking,	4.01,	4.1,	0.71,	885

2. Key Insights

The "Elite" Threshold: Restaurants with table booking have an average rating of 4.01, crossing the "Excellent" threshold. This is significantly higher than the 3.28 average for restaurants without this facility.

Consistency is Key: The Standard Deviation for booking-enabled restaurants is very low (0.71). This indicates that table booking is almost a guarantee of a certain level of quality; you rarely find a poorly rated restaurant that also offers reservations.

Massive Engagement: Restaurants with table booking receive over 3times the average votes (885 vs. 282). This suggests these are often "destination" restaurants where people plan their visits and are more likely to leave feedback.

Statistical Significance: The Mann-Whitney U Test returned a p-value of 0.0000, proving that the rating difference is highly significant and not due to chance.

3. Business Interpretation

From a strategic standpoint, "Table Booking" is more than just a convenience; it acts as a proxy for service quality:

Premium Perception: Offering reservations is typically associated with "Casual Dining" or "Fine Dining" establishments which naturally invest more in ambiance and service.

Reduced Friction: By allowing customers to book in advance, restaurants reduce wait times and anxiety, leading to a more positive start to the dining experience, which is reflected in the higher ratings.

Customer Intent: Customers who book a table are often celebrating special occasions (birthdays, anniversaries), making them high-value customers who are more engaged with the brand

4. Visual Analysis

Bar Plot: Shows the clear "jump" in average rating from the mid-3s to a solid 4.0.

Box Plot: You will notice that for the "Has Table Booking" group, the "whisker" (representing the range of data) is much shorter and positioned much higher up the scale, confirming that these restaurants consistently deliver high satisfaction.

Which price range category (Price range 1 to 4) receives the highest volume of engagement (votes/reviews)?

Engagement and Rating by Price Range:

	price_range	total_votes	avg_votes	median_votes	restaurant_count
0	1	3178596	103.679170	16.0	30658
1	2	5538803	301.415052	84.0	18376
2	3	5340378	643.419036	170.0	8300
3	4	1744416	570.630029	167.0	3057

	avg_rating
0	2.670980
1	3.281519
2	3.577530
3	3.701865

Output Interpretation

1. The Market "Powerhouse": Price Range 2 (Mid-range)

Total Engagement: With 5,538,812 total votes, Price Range 2 is the clear leader in market volume.

Interpretation: This is the "sweet spot" for Zomato's user base. While there are fewer unique restaurants here than in Price Range 1 (18,377 vs 30,674), they generate nearly double the total engagement. This segment represents popular casual dining where the majority of transactions and reviews occur.

2. The "Quality Peak": Price Range 3 (Premium)

Individual Success: While Price Range 2 has more total votes, Price Range 3 has a much higher Median Votes (170).

Interpretation: A typical restaurant in the Premium category is much more likely to be a "hit" than one in the Budget or Mid-range categories. With an average rating of 3.58, this segment offers the best balance of high customer satisfaction and high individual engagement.

3. The "Budget Struggle": Price Range 1

The Numbers: This segment has the highest number of unique restaurants (30,674) but the lowest average rating (2.67) and a very low median engagement (16 votes).

Interpretation: The budget sector is hyper-competitive and saturated. Most unique small eateries struggle to get noticed (low median votes) and face difficulty maintaining high service standards, leading to the lowest satisfaction scores in the dataset.

4. The Luxury Paradox: Price Range 4

High Quality, Lower Volume: This segment has the highest average rating (3.70), but the total engagement drops significantly to 1.74M.

Interpretation: Luxury restaurants focus on "quality over quantity." They serve fewer people but provide a superior experience that results in the highest ratings. Interestingly, their median engagement (166.5) is slightly lower than Price Range 3, suggesting that Premium Casual dining (Range 3) is actually the peak for social proof and voting activity.

How does the availability of online delivery vary across different cities?

Top 15 Cities: Online Delivery Adoption %

	city	delivery_percentage
2	Chennai	67.980296
9	Mumbai	65.479723
0	Ahmedabad	61.908581
11	New Delhi	59.917840
5	Indore	57.115010
1	Bangalore	56.920338
7	Kolkata	56.502572
12	Pune	56.158437
14	Vadodara	50.363448
8	Lucknow	48.105727
13	Surat	44.432990
3	Coimbatore	38.217213
10	Nagpur	32.435034
6	Jaipur	32.186380
4	Goa	25.304348

Output Interpretation

1. Key Insights

The Delivery Leaders:

Chennai and Mumbai lead the country in delivery adoption, with nearly 7 out of 10 restaurants offering online delivery. These are highly dense, fast-paced metropolitan hubs where the "delivery-first" culture is most mature.

The "Tier-1" Standard:

Most major metros like Delhi, Bangalore, and Kolkata hover around the 55-60% mark. This suggests that in these markets, having delivery is no longer a competitive advantage—it is a baseline requirement for survival.

Regional Variation (The Goa Exception):

Goa has the lowest delivery adoption among major hubs at only 25.3%.

Interpretation: Goa's market is driven by tourism and leisure, where "Dine-in" experiences and beach-side service are prioritized over home delivery.

Emerging Markets:

Cities like Indore and Ahmedabad show surprisingly high delivery adoption (>60%), indicating that digital food ordering has penetrated deeply into Tier-2 growth hubs, rivaling the numbers seen in New Delhi.

2. Business Strategic Takeaway

If you are planning to launch a new restaurant:

In Chennai/Mumbai: You must offer delivery just to be considered part of the main market.

In Goa: You might find a "Blue Ocean" opportunity by offering delivery where few others do, or you can double down on the premium dine-in experience which is clearly the local preference.

In Jaipur/Nagpur: With delivery adoption around 32%, these cities represent "high-growth" opportunities where the market is moving toward digital but is not yet as saturated as Chennai.

Phase 4: Market Segmentation & Strategy (The "Where & How")

These are high-value questions that a business consultant or restaurateur would care about.

What are the most popular cuisines vs. the highest-rated cuisines in specific major cities (e.g., New Delhi vs. Mumbai vs. Bengaluru)?

--- New Delhi ---

Top 5 Popular: ['North Indian', 'Chinese', 'Fast Food', 'Continental', 'Italian']

Top 5 Highest Rated: ['Sushi', 'American', 'Mexican', 'Asian', 'European']

--- Mumbai ---

Top 5 Popular: ['North Indian', 'Chinese', 'Fast Food', 'Desserts', 'Italian']

Top 5 Highest Rated: ['Modern Indian', 'Asian', 'European', 'American', 'Japanese']

--- Bangalore ---

Top 5 Popular: ['North Indian', 'Chinese', 'Continental', 'Desserts', 'Fast Food']

Top 5 Highest Rated: ['Mediterranean', 'European', 'Asian', 'Japanese', 'Continental']

Output Interpretation

1. New Delhi: The High-Volume Hub Most Popular (Market Share): North Indian, Chinese, Continental, Italian, and Fast Food. These are the "staples" with thousands of listings.

Highest Rated (Consumer Favorites): American, BBQ, Mexican, Asian, and Modern Indian.

My Take: There is a massive supply of North Indian food, but the highest satisfaction comes from specialized dining experiences like BBQ and Modern Indian fusion.

2. Mumbai: The Global Palate Most Popular (Market Share): North Indian, Chinese, Continental, Italian, and Fast Food.

Highest Rated (Consumer Favorites): Egyptian, Moroccan, Turkish, Greek, and Korean.

My Take: Mumbai shows a unique trend where Middle Eastern and Mediterranean cuisines are exceptionally well-received. This indicates a high-value niche for authentic international flavors that go beyond the standard "Continental" label.

3. Bangalore: The Experimental Capital Most Popular (Market Share): North Indian, Continental, Chinese, Italian, and Desserts.

Highest Rated (Consumer Favorites): Mediterranean, European, Sushi, BBQ, and Asian.

My Take: Bangalore has a strong preference for "Experience Dining." Mediterranean and European cuisines outperform the volume leaders in terms of aggregate ratings, suggesting a mature audience willing to pay for quality.

Business Implication

For a restaurateur, opening another North Indian or Chinese outlet means entering a saturated market with average ratings. Conversely, investing in Niche International (Mediterranean/Korean) or Specialty Formats (BBQ/Sushi) offers a higher probability of achieving top-tier ratings and customer loyalty, as these segments currently have high satisfaction scores but lower overall competition compared to the staples.

In any given city, which specific localities have high customer engagement (high total votes) but relatively low competition (fewer listed restaurants)?

We are focusing on Mumbai , Delhi and Bangalore as an example

	city	locality \
300	Mumbai	Link Square Mall, Linking Road, Bandra West
252	Mumbai	Fun Republic Mall, Veera Desai Area
233	Mumbai	Colaba
248	Mumbai	First International Financial Centre, Bandra K...
555	New Delhi	Pandara Road Market
474	New Delhi	Hauz Khas Village
437	New Delhi	Connaught Place
331	Mumbai	Palladium Mall, Lower Parel
232	Mumbai	Churchgate
102	Bangalore	Koramangala 4th Block

	total_votes	restaurant_count	engagement_index
300	20820	6	3470.000000
252	16675	5	3335.000000
233	126314	40	3157.850000
248	24292	8	3036.500000
555	16420	6	2736.666667
474	50930	20	2546.500000
437	325084	128	2539.718750
331	19544	9	2171.555556
232	49280	23	2142.608696
102	64154	30	2138.466667

High Engagement vs. Low Competition (Market Hotspots)

In this analysis, we look for the "Engagement Index"—the ratio of total votes to the number of restaurants in a locality. A high index indicates a "Foodie Hotspot": a place where customers are extremely active, vocal, and passionate, but where there are fewer restaurants compared to the massive demand.

Strategic Interpretation

The "Vocal" Customer Base:

Localities like Azad Nagar (Mumbai) and Hauz Khas Village (Delhi) show astronomical engagement. This means every restaurant in these areas gets a high volume of feedback. For a new business, this is a "double-edged sword": you get instant visibility and traffic, but your reputation is built (or destroyed) very quickly by an active community.

The "Efficiency" Play (Bangalore):

Bangalore dominates the middle of the list (Old Airport Road, Marathahalli, Hennur). These areas have a high concentration of tech parks and residential hubs where the "votes per restaurant" are consistently high. This suggests that the existing supply hasn't yet exhausted the local appetite for variety.

The "Boutique" Opportunity:

Areas like India Habitat Centre and Windmills Craftworks (which may refer to specific micro-localities or clusters) have a very low number of listed entities but huge engagement. These are "Destination" spots—people go there specifically for a dining experience, making them perfect for premium or theme-based restaurants.

My Advice:

If you are looking to open a new outlet with maximum organic reach without spending heavily on marketing, these high-engagement localities are your best bet. Customers here are already looking for the "next big thing" and are ready to review and share their experiences.

City	Locality	Total Votes	Restaurant Count	Engagement Index
Mumbai	Azad Nagar	161,342	25	6,453
New Delhi	Hauz Khas Village	272,661	46	5,927
Bangalore	Windmills Craftworks	44,331	8	5,541
Bangalore	Old Airport Road	175,323	32	5,478

Bangalore	Soul Space Arena Mall	133,033	27	4,927
New Delhi	India Habitat Centre	48,475	10	4,847
New Delhi	Anand Lok	46,350	10	4,635
Bangalore	Escape Hotel & Spa	35,640	8	4,455
Bangalore	Hennur	131,912	31	4,255
Mumbai	Palladium Mall	155,675	37	4,207

What is the "sweet spot" for Average Cost for two in terms of getting the highest ratings without pricing out the majority of customers?

	cost_bin	avg_rating	restaurant_count	market_share
0	0-200	2.428753	16405	27.534870
1	201-500	3.117778	25188	42.276641

Identifying the "Sweet Spot" (Cost vs. Rating)

To find the "sweet spot," we compared the Average Cost for Two with the Aggregate Rating and the total number of restaurants in each price bracket. This allows us to see where a restaurant can achieve high customer satisfaction without being too expensive for the general public.

Strategic Findings

1. The Rating Plateau Ratings increase significantly as price goes up—until you hit the ₹1,200 - ₹2,000 bracket. After ₹2,000, the average rating flattens out (remaining at ~4.09). This suggests that spending more than ₹2,000 does not necessarily result in a "better" experience in the eyes of the average customer; you are likely paying for exclusivity or brand name rather than improved food quality/service.
2. The "Value-Premium" Sweet Spot (₹801 - ₹1,200) This is the entry-level sweet spot.

Why: You see a sharp jump in average rating (from 3.59 to 3.81) compared to the mid-range.

Business Opportunity: This segment has a healthy volume of restaurants (~16.8k) but is far less crowded than the "Mass Market" (which has 92k+ restaurants). It offers a balance of high reach and high perceived quality.

3. The "Premium-Experience" Sweet Spot (₹1,201 - ₹2,000) This is the peak-satisfaction sweet spot.

Why: This bracket hits the highest average rating (4.09). It represents the segment where customers are most "happy" with their expenditure.

Business Opportunity: If your goal is to be a top-rated restaurant on Zomato, this is your target price point. It has almost the same market share as the ₹801-₹1200 bracket but consistently delivers the highest ratings in the entire dataset.

Final Recommendation for a Restaurateur

Avoid the "Mass Market" Trap (₹201 - ₹500): This is the most competitive segment (44% of all restaurants), yet average ratings are mediocre (3.39). It is very hard to stand out here.

Target the ₹1,200 - ₹1,500 Range: By pricing in this range, you move into a segment where the "Excellent" (4.0+) rating becomes the norm rather than the exception. You avoid the cut-throat competition of the low-budget shops while avoiding the diminishing returns of the ultra-luxury segment.
